

Learn how to use the Performance Monitor to measure power consumption and additional performance statistics on your Windows AI PC in this guide.

Installation of Performance Monitor in Windows

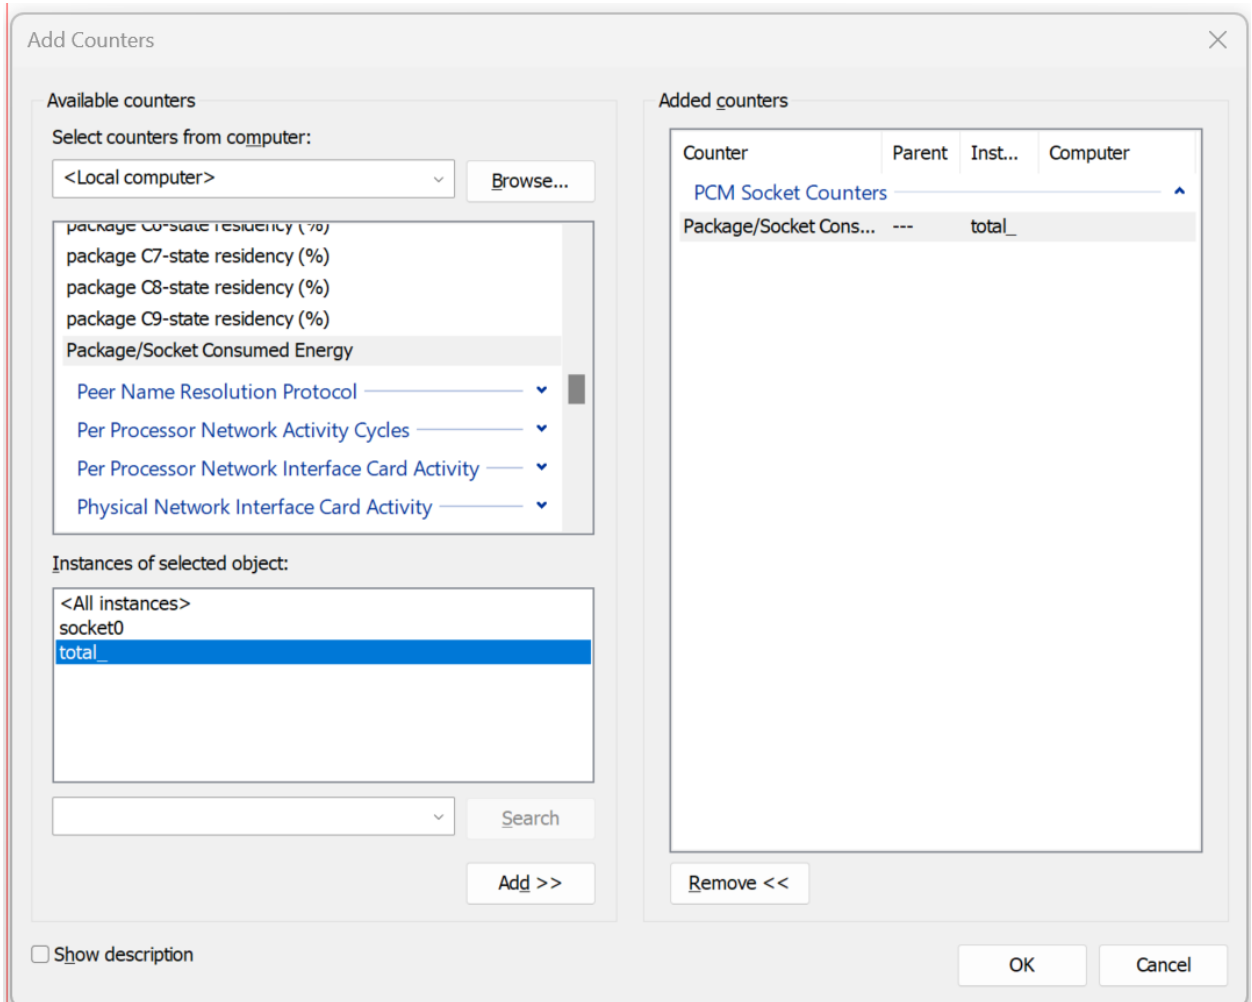

1. Download and unpack
<https://ci.appveyor.com/api/buildjobs/ya2o02uo3hpt8hil/artifacts/pcm-all.zip>
2. Download the free RealTemp utility package from <http://www.techpowerup.com/realtemp/> or any other free utility that uses the open-source WinRing0 driver
3. Copy WinRing0.dll, WinRing0.sys, WinRing0x64.dll, WinRing0x64.sys files from there into the PCM.exe binary location, into the PCM-Service.exe location and into c:\windows\system32
4. Run the PCM.exe tool from command line (admin)
5. Execute "'PCM-Service.exe' -Install" from this directory (admin)
6. Execute 'net start pcmservice' (admin)
7. Start Performance Monitor in Windows (Note: Need to find "Performance Monitor" in your own language if your OS is not in English)

8. Click “+” and select PCM Socket Counter

9. Select Package/Socket Consumed Energy and total and it to “Added counter”

10. You can monitor power consumption now
